Java Data Management System
Project Requirements

MVP (Minimum Viable Product)

Any items marked incomplete in this section will result in the project receiving a failing grade.

	Complete?
Implement at least three interfaces in your app for your objects to inherit from.	
Implement at least two abstract classes in your app for your objects to inherit from.	
Implement at least one Singleton pattern (data manager, logger, etc.).	
Implement at least one Builder or Factory pattern, as appropriate to your objects.	
Design and use data objects that are created via a design pattern and inherit from at least one other class.	
Users can create complex and custom objects.	
Users can conduct a search to find objects based on their properties.	
Users can update existing objects.	
Users can delete specific objects.	
Users can gracefully close the application.	
When an object is created, the app saves it to a data file.	
When an existing object is updated, the app saves the updated data back to the data file, replacing the old data.	
When an existing object is deleted, the app removes the data from the data file.	
When launched, the app should read the data file and use it to create objects in memory.	
The GitHub repo for the project contains a runnable JAR file that allows users to download and run the project.	
Unit tests should exist for each piece of functionality present in the app.	

Code Convention and UI/UX Requirements

More than two items marked incomplete in this section will result in the project receiving a failing grade.

	Complete?
The files in the app are organized following the conventions demonstrated in lectures.	
The code in the app adheres to coding conventions covered in lessons, like using plural names for arrays.	
The app does not contain dead code, commented-out sections, or console logs.	
The app is appropriately broken down into classes and functions with distinct roles.	
The app can be used without encountering errors, and appropriately uses error handling.	
The app is coded using proper indentation.	
The app's menu is easily navigable by a first-time user.	

Git and GitHub Requirements

Any items marked incomplete in this section will result in the project receiving a failing grade.

	Complete?
You are shown as the only contributor to the project on GitHub.	
The GitHub repository used for the project must be named appropriately. For example, names like dictionary-application or wellness-tracker are appropriate, whereas ga-project is not. The repo must be publicly accessible. *Be sure to create the repo on your personal GitHub account and ensure it is public.*	
Commit messages should be descriptive of the work done in that commit.	

README Requirements

More than two items marked incomplete in this section will result in the project receiving a failing grade.

	Complete?
Your app's name.	
A brief description of your app and its functionality.	
A *Getting started* section. This section should include instructions on how to download and use your app.	
A *Technologies used* section. This section should list the principal technologies used by your application, for example, Java and any major frameworks or libraries.	
If necessary, your README should contain an *Attributions* section. This section should include links to any external resources (such as libraries or assets) you used to develop your application that require attribution. You can exclude this section if it does not apply to your application.	

Presentation Requirements

Any items marked incomplete in this section will result in the project receiving a failing grade.

	Complete?
Present your project in front of the class on the scheduled presentation day.	

Summary

Project meets minimum requirements and passes.
